

Is Bess an emerging technology?

Because of its relatively recent inclusion in power systems, most international electricity markets consider BESS an emerging technology, despite some technologies already being commercially established and successful. Experience in the African context is even more limited with very few grid-scale BESS projects that are operational.

How big is Bess in Africa compared to global projections?

Confirmed development of BESS across the continent is still small compared to global projections, less than 0.5% of the global BESS capacity of 358GW by 2030. Considering Africa's rapidly growing power requirements and the already planned contributions from VRE, these commitments do not fully reflect the potential for BESS on the continent.

What is Bess & why is it important?

BESS will contribute crucially to the new and evolving grid paradigm and system requirements, offering increased reliability, resilience, grid modernisation and flexibility for the integration of a diverse and distributed generation portfolio connected to diverse energy users.

What are the challenges faced by Bess projects?

In addition to the above, BESS projects are also subject to the hurdles common to infrastructure investment on the continent. These include high cost of capital, financial constraints of off-takers (local utilities and consumers) and construction and operating risks in some jurisdictions. consumer and a generator of electricity.

Is Bess a safe alternative to traditional grid reinforcement?

Lack of a legally binding and technology neutral definition for energy storage in regulations that help legitimize the use of BESS as an alternative to traditional grid reinforcement projects. Likewise, standards often require updating to ensure BESS installations adhere to safety, performance, and reliability requirements.

Which technology is best suited for a grid-scale Bess deployment?

Among the commercial technologies, lithium-ion batteries are best known. They have been the dominant technology for grid-scale applications, representing almost 60% of global grid-scale BESS deployments in 2021.
