

What are vibration damping electrical panel mounts?

Our vibration damping electrical panel mounts are vibration isolators that provide ideal mounting solution for electrical panels which are prone to vibrations from outside. Electrical panels and electric enclosures are mounted on engines which produce high vibration. The metal plates at top and bottom of the mounts provide ample mounting support.

What is an AVT anti vibration table?

The AVT anti vibration table offers a solid, stable surface developed specifically to help decrease vibration during measurement. When used in tandem with a weighing balance, the table allows the balance to perform with marked precision, despite air currents or movements that might cause readings to fluctuate.

How much vibration does an electronic enclosure withstand?

Even if intended for more mild environments, nearly all electronics are subject to some level of vibration during their lifecycle. Typical shock values for industrial use might be in the 5G to 10G range whereas systems on naval ships need to withstand shocks in excess of 20G. Looking for Electronic Enclosures?

What makes a good vibration isolator?

A good system has two main components, a spring to support the load and a damping element to dissipate the energy. Two common types of vibration isolators are used in rack configurations: Wire Rope Coils - the ideal solution for providing low frequency, highly damped vibration isolation and excellent shock attenuation.

What is a shock & vibration isolator?

The main goal in handling shock and vibration is to isolate the equipment from excitement by reducing the amplitude and frequency of waves. Enter: isolators. They're critical! And act as a highly stable buffer between the source of the vibration and the object or surface.

What are the different types of vibration isolators?

Two common types of vibration isolators are used in rack configurations: Wire Rope Coils - the ideal solution for providing low frequency, highly damped vibration isolation and excellent shock attenuation. They often require little maintenance, are made from durable metals and keep functioning under varying temperatures in corrosive environments.
