How does EIA determine the cost of a new power plant?

Five of the most notable parameters are: Financing: EIA determines the cost of capital required to build new power plants by calculating a weighted average cost of capital using a mix of macro-economic parameters determined through EIA's modeling and an assumed capital structure for the electric power industry.

Are EPC services and contingencies included in Bec?

The cost of EPC services and contingencies are not included in BEC. BEC is an overnight cost expressed in base-year dollars. The Engineering, Procurement and Construction Cost (EPCC) comprises the BEC plus the cost of services provided by the engineering, procurement and construction (EPC) contractor.

What costs are included in a construction project?

Electrical, instrumentation, controls supply, and installation cost including all costs for transformers, switchgear, control systems, wiring, instrumentation, and raceways. Project indirect costs including engineering, construction management, as well as start-up and commissioning.

What adjustments were made for regional ambient conditions for power plants?

For power plants that use CT technologies, adjustments were made for regional ambient conditions. The adjustments took into consideration that CTs are machines that produce power proportional to mass flow.

What is the difference between owner's costs and installation/repowering costs?

Installation/Repowering costs include road work, civil work, and WTG installation. 2. Owner's costs include project development, studies, permitting, legal, owner's project management, owner's engineering, and owner's startup and commissioning costs. Owner's contingency is applied to owner's services costs only.
