What is frequency regulation power optimization?

The frequency regulation power optimization framework for multiple resources is proposed. The cost, revenue, and performance indicators of hybrid energy storage during the regulation process are analyzed. The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established.

Is energy storage a new regulatory resource?

As a new type of flexible regulatory resource with a bidirectional regulation function [3,4], energy storage (ES) has attracted more attention in participation in automatic generation control (AGC). It also has become essential to the future frequency regulation auxiliary service market.

Do energy storage stations improve frequency stability?

With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system. The energy storage (ES) stations make it possible effectively. However, the frequency regulation (FR) demand distribution ignores the influence caused by various resources with different characteristics in traditional strategies.

What is the comprehensive efficiency evaluation system of energy storage?

The comprehensive efficiency evaluation system of energy storage by evaluating and weighing methods is established. The multi-level power distribution strategy based on comprehensive efficiencies of energy storage is proposed. With the rapid expansion of new energy, there is an urgent need to enhance the frequency stability of the power system.

Is there a market scheduling and pricing method for comprehensive frequency regulation services?

In this paper, a market scheduling and pricing method for comprehensive frequency regulation services (FRSs) is proposed. First, a modeling approach for flexible FR capabilities of WPGs is proposed based on the mechanism of inertia control and power reserve control.

What is the maximum FR efficiency of each ES unit?

The maximum comprehensive efficiency of each ES unit is 0.363 (ES6), while the minimum is only 0.076 (ES1), with a gap of about five times between them, showing a particular gap in FR effects between different ES units. Fig. 9. Comprehensive FR efficiency of each ES unit in the proposed strategy.
