

Microgrid Energy Storage Configuration Planning

What is the energy storage configuration and scheduling strategy for Microgrid?

1. An energy storage configuration and scheduling strategy for microgrid with consideration of grid-forming capability is proposed. The objective function incorporates both the investment and operational costs of energy storage. Constraints related to inertia support and reserved power are also established.

Why is energy storage important in a microgrid?

Optimizing the configuration and scheduling of grid-forming energy storage is critical to ensure the stable and efficient operation of the microgrid. Therefore, this paper incorporates both the construction and operational costs of energy storage into the objective function.

Does shared energy storage link multiple microgrids?

This paper focuses on shared energy storage that links multiple microgrids and proposes a bi-layer optimization configuration method based on a shared hybrid electric-hydrogen storage station for microgrids, combining cooling, heating, and power systems, to better achieve efficient energy utilization and promote sustainable development.

Does shared energy storage reduce the dependency of a microgrid cluster?

It also reduces the dependency of a microgrid cluster on both shared energy storage and distribution grid when compared to models relying solely on self-built or leased mode. This study can guide investors and microgrid cluster operators in planning and implementing shared energy storage.
