What is demand charge management in a PV plus storage system?

For example, demand charge management through a PV plus storage system dictates the strategy for when to discharge the battery and when to charge it. In these situations, the control algorithm will be more complicated and likely call for some degree of forecasting and monitoring PV power, load profiles, and demand charges.

How much does a PV system cost?

Another estimate approximates O&M of PV systems at \$40/kW/year (about 0.5% of initial cost per year for these early systems), about half of which is amortized inverter replacements (Wiser, Barbose, and Peterman 2009).

Why should you track energy availability in a PV operation contract?

Tracking this availability (or unavailability) provides transparency into the equipment reliability status to all parties involved in an O&M services contract. In most PV operation contracts, energy will be the driving factor of whether the system is operating as expected.

How to maximize PV power consumption?

As discussed above, the most common approach is to take advantage of the battery to maximize usage of the power that is being generated by the PV to minimize curtailment during the day.

How does energy affect a PV operation contract?

In most PV operation contracts, energy will be the driving factor of whether the system is operating as expected. EPC guarantees, operator guarantees, owner measure of ROI, and other considerations for a contract are mostly based on whether the system produced energy as it was expected to.

Why is energy availability important in assessing PV systems?

Both energy and availability are necessary metrics for assessing PV systems. If the stakeholders involved in a contract are most interested in energy production, and if the contract holds parties responsible for energy production, then it is crucial that energy losses associated with unavailability and system performance are accounted for.
