

Reliable quality power grid base station

What type of generator does a base station use?

The air conditioning of the base station runs at 220 VAC. These base stations can be powered by two types of diesel generators. The first is the conventional type where 220 VAC is converted to 48 VDC to charge the batteries and power the communication equipment.

How much power does a cellular base station use?

This problem exists particularly among the mobile telephony towers in rural areas, that lack quality grid power supply. A cellular base station can use anywhere from 1 to 5 kW power per hour depending upon the number of transceivers attached to the base station, the age of cell towers, and energy needed for air conditioning.

How can the electronic industry reduce power requirements for base stations?

As a result, the electronic industry is exploring new methods to reduce the power requirements for the electronic equipment used in the base stations. The first approach is to make the base stations more tolerant to heat which will then require less power for air conditioning.

Why do cellular base stations need maintenance?

Cellular base stations use power without any interruption and also need maintenance. The increase in demand of power base stations from Indian telecommunication industry is a big challenge, especially in rural India.

How do cellular base stations work?

Most transceivers in the cellular base stations are run by 48 VDC to charge the batteries and power the communication equipment. The air conditioning of the base station runs at 220 VAC. These base stations can be powered by two types of diesel generators.

How will cellular base stations affect global power consumption?

A recent study showed that global power consumption for cellular base stations will decline due to more efficient equipment and networks by nearly 3% annually while the cost of electricity powering these base stations will rise by 9% annually.
