

Second-life energy storage battery costs

How much does a second life battery cost?

However, the estimated cost of a second life battery, including all expenses, falls within the range of \$25 to \$49/kWh. Furthermore, even with the declining LIB costs, McKinsey still estimates a price savings of between 30 to 70% for purchasers of used batteries for second life applications as compared to new batteries in 2025.

Are second-life batteries a viable alternative to stationary batteries?

This story is contributed by Josh Lehman, Relyion Energy. Second-life batteries present an immediate opportunity, the viability of which will be proven or disproven in the next few years. Second-life batteries can considerably reduce the cost as well as the environmental impact of stationary battery energy storage.

Are second-life batteries the future of energy storage?

The potential for second-life batteries is massive. At scale, second-life batteries could significantly lower BESS project costs, paving the way for broader adoption of wind and solar power and unlocking new markets and use cases for energy storage.

Can repurposing second life batteries reduce energy costs?

Recent studies reveal multiple benefits of incorporating second life batteries into existing energy frameworks. One significant finding is that repurposing batteries can lead to reduced costs in energy supply chains.

What are the benefits of Second Life batteries?

The biggest benefit for Second life batteries (SLB) comes when partnered up with renewable energy sources. Since renewable energy tends to be unstable, utilizing SLB as an energy storage system offers a promising solution. Thanks to their scalability, flexibility, fast dynamics, and, most importantly, low cost.
