

What is Peak-Valley price arbitrage?

1. Peak-Valley Price Arbitrage Peak-valley electricity price differentials remain the core revenue driver for industrial energy storage systems. By charging during off-peak periods (low rates) and discharging during peak hours (high rates), businesses achieve direct cost savings. Key Considerations:

How energy storage systems can be used to generate arbitrage?

Due to the increased daily electricity price variations caused by the peak and off-peak demands, energy storage systems can be utilized to generate arbitrage by charging the plants during low price periods and discharging them during high price periods.

How do price differences influence arbitrage by energy storage?

Price differences due to demand variations enable arbitrage by energy storage. Maximum daily revenue through arbitrage varies with roundtrip efficiency. Revenue of arbitrage is compared to cost of energy for various storage technologies. Breakeven cost of storage is firstly calculated with different loan periods.

What is price arbitrage for electrical energy?

The concept of price arbitrage for electrical energy of Fig. 1 is based on the hourly electricity price from the California Independent System Operator (CAISO), for a typical day where hour 0 is defined as midnight (Blanke, 2018).

Can arbitrage compensate for energy losses introduced by energy storage?

The arbitrage performance of PHS and CAES has also been evaluated in five different European electricity markets and the results indicate that arbitrage can compensate for the energy losses introduced by energy storage (Zafirakis et al., 2016).

How can energy storage technologies be analyzed for maximum profitability?

Based on the above arbitrage revenue and capacity costs, the potential selections of energy storage technologies can be analyzed in more detail for maximum profitability once breakeven costs are achieved via attainment of technology readiness and/or system cost reductions.
