Will energy storage be a big time in 2025?

Energy storage for the electrical grid is about to hit the big time. By the reckoning of the International Energy Agency (IEA), a forecaster, grid-scale storage is now the fastest-growing of all the energy technologies. In 2025, some 80 gigawatts (GW) of new grid-scale energy storage will be added globally, an eight-fold increase from 2021.

Is grid-scale energy storage on the rise?

By the reckoning of the International Energy Agency (IEA), a forecaster, grid-scale storage is now the fastest-growing of all the energy technologies. In 2025, some 80 gigawatts (GW) of new grid-scale energy storage will be added globally, an eight-fold increase from 2021. Grid-scale energy storage is on the rise thanks to four potent forces.

Will energy storage hit the Big Time?

By Vijay Vaitheeswaran, Global energy and climate innovation editor, The Economist Energy storage for the electrical grid is about to hit the big time. By the reckoning of the International Energy Agency (IEA), a forecaster, grid-scale storage is now the fastest-growing of all the energy technologies.

What are the different types of energy storage technologies?

1. Pumped Hydro Storage (PHS) With over 160 GW of global installed capacity, pumped hydro is the most mature energy storage technology. It operates by pumping water uphill during periods of low demand and releasing it through turbines when electricity is needed.

Why is battery storage so important?

Electrification, integrating renewables and making grids more reliable are all things the world needs. However, these can't happen without an increase in energy storage. Battery storage in the power sector was the fastest growing energy technology commercially available in 2023 according to the IEA.
